

Amendments In the Claims

Please amend Claims 1-6, 8-25, 50, and 53 as follows:

1. **(Currently Amended)** A method of arranging objects comprising:
 setting a class hierarchy, wherein
 the class hierarchy comprises an upper level class and a lower level class, and
 the objects are members of at least one of the upper level class and the lower
 level class;
 assigning a first ~~an~~ attribute to the upper level class, wherein
 the first attribute describes the objects;
 inheriting of the first attribute by the lower level class, wherein
 the first attribute is within a first domain with regard to the upper level class,
 the first attribute is within a second domain with regard to the lower level
 class,
 a second domain value set of the second domain is smaller than a first domain
 value set of the first domain, and
 the first attribute is restricted to the second domain value set upon the
 inheriting; ~~and~~
assigning a second attribute to the lower level class, wherein
 the second attribute describes an object associated with the lower level
 class;
 associating each object ~~an item~~ with a class within the class hierarchy such that
 each attribute describing the object has a non-null value, wherein
 said each attribute is a member of the set of attributes assigned to the
 class; and such that all entries of a record of the item are non-
 empty.
said method is performed by a processor configured to perform said method.

2. **(Currently Amended)** The method of arranging objects of claim 1, further
 comprising:
superseding ~~supereeding~~ said first attribute of said upper level class by assigning a
third ~~an~~ attribute to the lower level class, wherein

the third attribute describes describing an object that is associated with a member of the lower level class.

3. (Currently Amended) The method of arranging objects of claim 1, wherein the first attribute comprises a distinctive domain value set.

4. (Currently Amended) The method of arranging objects of claim 1, wherein the class hierarchy further comprises a third class below the lower level class in the class hierarchy, and further comprising:

inheriting of the first attribute and the second attribute by the third class.

5. (Currently Amended) The method of arranging objects of claim 1, further comprising:

expanding the class hierarchy horizontally by adding a fourth class to the lower level class; and

inheriting of the first attribute by the fourth class.

6. (Currently Amended) A hierarchical class architecture of objects stored in a memory comprising:

an upper level class;

a lower level class, wherein the upper and lower level classes are stored in the memory;

a first domain value set of a first domain of the upper level class;

a second domain value set of a second domain;

a first an attribute, wherein

the first attribute is assigned to the upper level class,

the first attribute is within the first domain,

the first attribute is within the second domain,

the objects are members of at least one of the upper level class and the lower level class,

the first attribute describes the objects,

the lower level class is configured to inherit the first attribute,

the second domain value set is smaller than the first domain value set, and

the first attribute is restricted to the second domain value set upon the first attribute being inherited by the lower level class; and

a second attribute, wherein

the second attribute is assigned to the lower level class,

the second attribute is within the second domain, and

the second attribute describes an object associated with the lower level class, and

each the object item in the hierarchical class architecture of objects is

associated with a class within the class hierarchy such that each

attribute describing the object has a non-null value, wherein such

~~that the entries are non-empty~~

said each attribute is a member of the set of attributes assigned to the class.

~~an item having a record with a plurality of entries, wherein~~

7. (Original) The hierarchical class architecture of claim 6, further comprising:
an additional attribute, wherein

the additional attribute is assigned to the lower level class, and

the attribute describes an object in the lower level class.

8. (Currently Amended) The hierarchical class architecture of claim 6,
wherein the first attribute comprises a distinctive domain value set.

9. (Currently Amended) The hierarchical class architecture of claim 6, further comprising:

a third class, wherein

the third class is below the lower level class in the hierarchical class architecture, and

the third class is configured to inherit the first attribute and the second attribute.

10. (Currently Amended) The hierarchical class architecture of claim 6, wherein

the lower level class is configured to be expanded horizontally by virtue of being configured to provide for addition of a **fourth** class, and the **fourth** class is configured to inherit the **first** attribute.

11. (Currently Amended) A computer system comprising:
a processor;

a computer readable medium coupled to the processor; and
computer code, encoded in the computer readable medium, configured to cause the processor to:

set a class hierarchy, wherein

the class hierarchy comprises an upper level class and a lower level class, and

the objects are members of at least one of the upper level class and the lower level class;

assign **a first** ~~an~~ attribute to the upper level class, wherein

the **first** attribute describes the objects;

provide inheritance of the **first** attribute by the lower level class, wherein

the **first** attribute is within a first domain with regard to the upper level class,

the **first** attribute is within a second domain with regard to the lower level class,

a second domain value set of the second domain is smaller than a first domain value set of the first domain, and

the **first** attribute is restricted to the second domain value set upon the inheritance of the attribute by the lower level class; ~~and~~

assign a second attribute to the lower level class, wherein

the second attribute describes an object associated with the lower level class; and

associate each object ~~an item~~ with a class within the class hierarchy such that each attribute describing the object has a non-null value, wherein said each attribute is a member of the set of attributes assigned to the class. ~~such that all entries of a record of the item are non-empty.~~

12. (Currently Amended) The computer system of claim 11, wherein the computer code is further configured to cause the processor to:
assign an third attribute to the lower level class, the third attribute describing an object that is a member of the lower level class.
13. (Currently Amended) The computer system of claim 11, wherein the first attribute comprises a distinctive domain value set.
14. (Currently Amended) The computer system of claim 11, wherein the class hierarchy further comprises a third class below the lower level class in the class hierarchy, and the computer code is further configured to cause the processor to:
provide inheritance of the first attribute and the second attribute by the third class.
15. (Currently Amended) The computer system of claim 11, wherein the computer code is further configured to cause the processor to:
expand the class hierarchy horizontally by adding a fourth class to the lower level class; and
provide inheritance of the first attribute by the fourth class.
16. (Currently Amended) An apparatus for arranging objects comprising:
means for setting a class hierarchy, wherein
the class hierarchy comprises an upper level class and a lower level class, and
the objects are members of at least one of the upper level class and the lower level class;
means for assigning a first ~~an~~ attribute to the upper level class, wherein the first attribute describes the objects;
means for inheriting of the first attribute by the lower level class, wherein

the first attribute is within a first domain with regard to the upper level class,
 the first attribute is within a second domain with regard to the lower level
 class,
 a second domain value set of the second domain is smaller than a first domain
 value set of the first domain, and
 the first attribute is restricted to the second domain value set by the means for
 inheriting; **and**

means for assigning a second attribute to the lower level class, wherein
the second attribute describes objects associated with the lower level
class; and

means for associating each object ~~an item~~ with a class within the class hierarchy
such that each attribute describing the object has a non-null value,
wherein ~~such that all entries of a record of the item are non-empty.~~
said each attribute is a member of the set of attributes assigned to the
class.

17. (Currently Amended) The apparatus of claim 16, further comprising:
 means for superseding ~~supereeding~~ said first attribute of said upper level class
 comprising means for assigning a third ~~an~~ attribute to the lower level class,
wherein
 the third attribute describes ~~describing~~ an object that is associated with a
~~member of~~ the lower level class.

18. (Currently Amended) The apparatus of claim 16, wherein the first attribute
 comprises a distinctive domain value set.

19. (Currently Amended) The apparatus of claim 16, wherein the class
 hierarchy further comprises a third class below the lower level class in the class hierarchy,
 and further comprising:
 means for inheriting of the first attribute and the second attribute by the third class.

20. **(Currently Amended)** The apparatus of claim 16, further comprising:
 means for expanding the class hierarchy horizontally by adding a **fourth** class to the
 lower level class; and
 means for inheriting of the **first** attribute by the **fourth** class.

21. **(Currently Amended)** A computer program product, encoded in computer
 readable media, comprising:

- a first set of instructions, executable on a computer system, configured to set a class
 hierarchy, wherein
 the class hierarchy comprises an upper level class and a lower level class, and
 the objects are members of at least one of the upper level class and the lower
 level class;
- a second set of instructions, executable on the computer system, configured to assign
a first ~~an~~ attribute to the upper level class, wherein the **first** attribute
 describes the objects;
- a third set of instructions, executable on the computer system, configured to provide
 inheritance of the **first** attribute by the lower level class, wherein
 the **first** attribute is within a first domain with regard to the upper level class,
 the **first** attribute is within a second domain with regard to the lower level
 class,
 a second domain value set of the second domain is smaller than a first domain
 value set of the first domain, and
 the **first** attribute is restricted to the second domain value set by the third set
 of instructions; **and**
- a fourth set of instructions, executable on the computer system, configured to**
assign a second attribute to the lower level class, wherein
the second attribute describes an object associated with the lower level
class; and
- a **fifth** ~~fourth~~ set of instructions, executable on the computer system, configured to
 associate **each object** ~~an item~~ with a class within the class hierarchy **such**
that each attribute describing the object has a non-null value, wherein
such that all entries of a record of the item are non-empty.

said each attribute is a member of the set of attributes assigned to the class.

22. (Currently Amended) The computer program product of claim 21, further comprising:
a ~~sixth~~ **fourth** set of instructions, executable on the computer system, configured to ~~supersede~~ **supereede** said **first** attribute of said upper level class by virtue of being configured to assign a **third** ~~an~~ attribute to the lower level class, the **third** attribute describing an object that is **associated with a member of** the lower level class.
23. (Currently Amended) The computer program product of claim 21, wherein the **first** attribute comprises a distinctive domain value set.
24. (Currently Amended) The computer program product of claim 21, wherein the class hierarchy further comprises a **third** class below the lower level class in the class hierarchy, and further comprising:
a ~~seventh~~ **fourth** set of instructions, executable on the computer system, configured to provide inheritance of the **first attribute and the second** attribute by the **third** class.
25. (Currently Amended) The computer program product of claim 21, further comprising:
an eighth ~~a fourth~~ set of instructions, executable on the computer system, configured to expand the class hierarchy horizontally by adding a **fourth** class to the lower level class; and
a **ninth** ~~fifth~~ set of instructions, executable on the computer system, configured to provide inheritance of the **first** attribute by the **fourth** class.
26. (Previously Presented) The method of arranging objects of claim 1, further comprising:
associating the upper level class with the first domain value set, and
associating the lower level class with the second domain value set.

27. (Previously Presented) The method of arranging objects of claim 26, wherein another attribute is within the second domain.

28. (Previously Presented) The method of arranging objects of claim 27, wherein the another attribute is an overriding attribute.

29. (Previously Presented) The method of arranging objects of claim 27, further comprising:

superceding the attribute with the another attribute, wherein
the superceding is performed if the second domain is different from the first domain.

30-32. Cancelled.

33. (Previously Presented) The hierarchical class architecture of objects of claim 6, further comprising:

another attribute, wherein the another attribute is another attribute within the second domain.

34. (Previously Presented) The hierarchical class architecture of objects of claim 33, wherein
the another attribute is an overriding attribute.

35. (Previously Presented) The hierarchical class architecture of objects of claim 33, wherein

the another attribute is configured to supercede the attribute, and
the another attribute supercedes the attribute if the second domain is different from the first domain.

36-37. Cancelled.

38. (Previously Presented) The computer system of claim 11, wherein the computer code is further configured to cause the processor to:

associate the upper level class with the first domain value set, and
associate the lower level class with the second domain value set.

39. (Previously Presented) The computer system of claim 38, wherein another attribute is within the second domain.

40. (Previously Presented) The computer system of claim 39, wherein the another attribute is an overriding attribute.

41. (Previously Presented) The computer system of claim 39, wherein the computer code is further configured to cause the processor to:
supercede the attribute with the another attribute, if the second domain is different from the first domain.

42-43. Cancelled.

44. (Previously Presented) The apparatus of claim 16, wherein the computer code is further configured to cause the processor to:
associate the upper level class with the first domain value set, and
associate the lower level class with the second domain value set.

45. (Previously Presented) The apparatus of claim 44, wherein another attribute is within the second domain.

46. (Previously Presented) The apparatus of claim 45, wherein the another attribute is an overriding attribute.

47. (Previously Presented) The apparatus of claim 45, further comprising:
means for superceding the attribute with the another attribute, wherein
the superceding is performed if the second domain is different from the first domain.

48-49. Cancelled.

50. (**Currently Amended**) The computer program product of claim 21, further comprising:
a tenth ~~fourth~~ set of instructions, executable on the computer system, configured to
associate the upper level class with the first domain value set; and

an eleventh ~~a fifth~~ set of instructions, executable on the computer system, configured to associate the lower level class with the second domain value set.

51. (Previously Presented) The computer program product of claim 50, wherein

another attribute is within the second domain.

52. (Previously Presented) The computer program product of claim 51, wherein

the another attribute is an overriding attribute.

53. (**Currently Amended**) The computer program product of claim 51, further comprising:

a **twelfth** ~~sixth~~ set of instructions, executable on the computer system, configured to supercede the attribute with the another attribute, if the second domain is different from the first domain.

54-55. Cancelled.
